Method to increase the antioxidant activity of chocolate

Abstract of EP 1894473 (A1)
The present invention relates to a novel method for conching chocolate, whereby a chocolate mass is submitted to a conching method that comprises the following steps: - a dry conching step performed at a temperature of between 50 DEG C and 70 DEG C, - and a subsequent wet conching step performed at a temperature of between 65 DEG C and 110 DEG C. Most preferably the dry conching step is performed at about 65 DEG C and the wet conching step at about 90 DEG C or 95 DEG C. Advantageously, this adjusted conching process conserves and even increases the antioxidant activity of a chocolate. Consequently, the present invention further relates to a method of conserving and/or increasing the antioxidant activity of chocolate and to chocolates processed accordingly.
